

Committee: UNITED NATIONS ENVIRONMENT PROGRAM

COUNTRY: NORTH KOREA

DELEGATE NAME:Yusuf Eroğlu

Climate change is undoubtedly one of the biggest and most hazardous problems of our time.

As North Korea, we have been struggling with this problem for years. Disasters such as typhoons and floods that we have experienced for years have caused serious damage to our cities.

But we have ongoing projects and work on these issues, such as renewing the infrastructure of cities and providing financial support to farmers.

North Korea and our world truly have wonderful nature, but climate change has destroyed this beautiful nature.

As North Korea, we are doing our best to prevent and take precautions against climate change. In addition, North Korea has signed important agreements to prevent the climate crisis, such as the Vienna Convention on climate change, the Paris Agreement, and the Kyoto Protocol.

We also increased the use of solar energy and wind turbines.

So what can be done to prevent the global climate crisis?

- The use of electric vehicles can be increased, but there is a point here; Electric vehicle charging stations will work with solar energy
- Governments should impose more serious sanctions on people who harm the environment

In our opinion, countries' wastes that harm nature, such as chemical waste and carbon emissions, should be limited annually.

Countries that exceed this annual limit should be fined, and part of the money should be transferred to countries suffering from water scarcity, and the other part should be transferred to United Nations D&S expenditures.

If these suggestions are taken into account and everyone takes action against the climate crisis, the world could be a much better place.
