

Committee : United Nations Environment Program  
Subject : Assessment of the Current Situation of the Climate Crisis  
Country : Pakistan  
School / University : Elazığ Final Academy School  
Delegate Name : Cemre Gül Ertuş

Global warming and climate crisis, are among the most important issues of the world today and affect not only certain countries but almost all countries. The main causes of the climate crisis include excessive use of fossil fuels, greenhouse gases unconsciously released into the air, inability to use public transportation and destruction of forests. The climate crisis and increasing environmental pollution cause many problems such as high temperatures, drought, forest fires, floods, decrease in biodiversity, melting of glaciers, and rising sea levels. Pakistan is one of the countries affected by these problems. Industrialized countries need to realize that nature does not belong to a single country but that all countries will be affected when the ozone layer is damaged. As a result of all this, nature attacks developing countries with low greenhouse gas emissions.

Pakistan is one of these countries. Pakistan has been struggling with intense floods for the last two years. We continue our work after the disaster that flooded a significant part of our country. Moreover, floods are not the only problem our country is struggling with. At the same time, intense glacier melting in the northern regions and extreme temperatures experienced in the summer months in the southern cities continue to cause loss of life and material damage.

Agriculture forms the basis of Pakistan's economy, which has been damaged by both drought and floods. While flood waters are decreasing, stagnant waters polluted by flood waters pose a threat to the public. Water pollution restricts access to already scarce water, causing a severe water shortage for both drinking water and agricultural irrigation in Pakistan. In addition, the fact that India has built more than fifty dams on the rivers coming to Pakistan is of vital importance for Pakistan's water and energy security in the current situation. Despite all this, as the Pakistani government, we work with non-governmental organizations to combat the climate crisis and overcome disasters. At the same time, we support all kinds of national and international work in the field of combating the climate crisis. Chief among these is the Paris Climate Agreement. We support the agreement to achieve its goals, just like the Kyoto Protocol.
