

Country:Nigeria

Committee:FAO1

Dear Delegates and President, I am honored to present this important issue at our conference!!

Nigeria is a country located in West Africa, the population of Nigeria is approximately 200 million.

One of the important studies carried out by FAO in Nigeria is food security and the fight against hunger. Although Nigeria is a country with a large population, it faces some challenges in food security. The projects and policies carried out by FAO in Nigeria are aimed at increasing food production, developing the agricultural sector and reducing hunger. These studies are of great importance to ensure that the Nigerian people have a healthy and balanced diet.

Efficiency in agricultural production is a critical factor for the sustainability of the agricultural sector and food security. Productivity in agricultural production in Nigeria is at low levels. There may be several reasons for this problem: factors such as inadequate farming infrastructure, limited access and use of fertilizers and modern farming techniques, climate change impacts, and lack of training and knowledge of farmers. These problems can lead to low productivity in agricultural production and difficulties in food security. Some solutions to increase productivity in agriculture:

Farmers can be trained about modern agricultural techniques so that they can learn more efficient production methods.

Thank you for listening to me.
