Country:South Korea
Committee:UNODC (United Nations Office for Drugs and Crime)
Agenda Item:Global Cooperation for Fighting Cyberbullying

South Korea is a country located in East Asia best known for its technology and effective popular culture. Its population according to the latest data is around 52 Million. It's a very innovative society aside from also being highly educated and advanced in the economic field. South Korea has also been an active participant in UN meetings.

We all know that technology gets better day by day to the point it's all around our everyday life.It's almost impossible stopping it from progressing and spreading globally.Technology is good and helpful but it has its flaws too. Cyberbullying is becoming a bigger problem globally as online platforms and social media spreads and gains popularity.The top three countries that have the most reported cases of any form of Cyberbullying being USA (United States of America), India and Brazil.This topic got so serious that a lot of countries have made policies and laws against Cyberbullying in the past.It is still a big problem in the present and South Korea supports that possible solutions that would be effective for a long term should be discussed and be legislated. One of the cyberbullying laws that South Korea has legislated in the past is South Korean cyber defamation/insult law that charges the culprit(s) with 3 years of imprisonment if the insulting information is in fact real and 7 years if not for the maximum charge. South Korea is ready to reduce the cyberbullying rates to the minimum rate and even better, put an end to it.

To work on cyberbullying prevention strategies, South Korea advises that we should educate people of all ages about the problem and improve technology to our advantage in this situation. To educate people on this topic we could mention it in schools for all ages or prepare seminars to spread awareness as much as we possibly can. As for using technology to our advantage we could work on Artificial Intelligence or a system that can analyze social media/online platforms content and automatically report it if it contains cyberbullying or it could check old cyberbullying cases and give us data to help prevent them and make it easier to find solutions. We are hoping to find solutions to cyberbullying and do the best we can.
