

India

Committee: LEGAL 1

Topic: Developing International Legal Frameworks for the Use of Artificial Intelligence

India, the largest democracy in the world with over 1.4 billion people, is located in South Asia and is one of the fastest-growing economies. We are a global leader in technology and innovation, especially in Artificial Intelligence (AI). AI has brought major advancements in areas like healthcare, farming, and education. It has helped improve crop yields, expand access to healthcare, and close gaps in education. These examples show AI's potential to make the world a better place.

However, while AI can help solve problems, it also brings challenges. Some of these include concerns about privacy, algorithmic bias that could lead to unfair treatment, and the danger of AI being used in harmful ways, like cybercrimes or autonomous weapons. What makes these problems worse is the lack of a unified set of global rules for AI. Many countries create their own policies, but these do not always work well together, especially for cross-border issues like data misuse or fake news. India believes it is essential for the world to come together to ensure AI is safe, ethical, and used for the benefit of everyone.

To address these challenges, India proposes several solutions. First, global auditing systems should be established to ensure AI systems are transparent and accountable to international standards. Second, ethical guidelines must be created to prevent the misuse of AI in areas like surveillance, disinformation, or weapons. These guidelines should focus on fairness and protecting human rights. Third, international collaboration in AI research and development should be encouraged, with partnerships between developed and developing nations to ensure AI is used equitably and responsibly. Finally, education and awareness are vital. Nations should invest in training programs to help people and institutions understand and apply AI responsibly.

India believes the United Nations should lead efforts to create this framework, making sure all nations, especially developing ones, are included in the process. By working together, the global community can ensure AI is a force for progress, not harm. India is committed to sharing its expertise and experiences to help create fair, balanced, and effective rules for AI. Together, we can ensure AI becomes a tool to address global challenges, reduce inequality, and improve the lives of people around the world.
